Website Specifications

Company introduction:

Website Goals:

- To cut down on the manual administration:
Reduce the amount of time employees spend manually entering data and making phone or email reservations.
- Boost client satisfaction and confidence:
To boost confidence and cut down on questions, provide clear car information, pricing, and rental terms.
- Increase discoverability:
Improve search visibility for local car rental queries.
- Keep data safe and secure:
Use HTTPS throughout the website, safeguard client data, and adhere to safe file upload and password storage procedures.
- Make sure accessibility and performance are mobile-first:
Provide quick, responsive pages that adhere to accessibility guidelines and function well on smartphones.

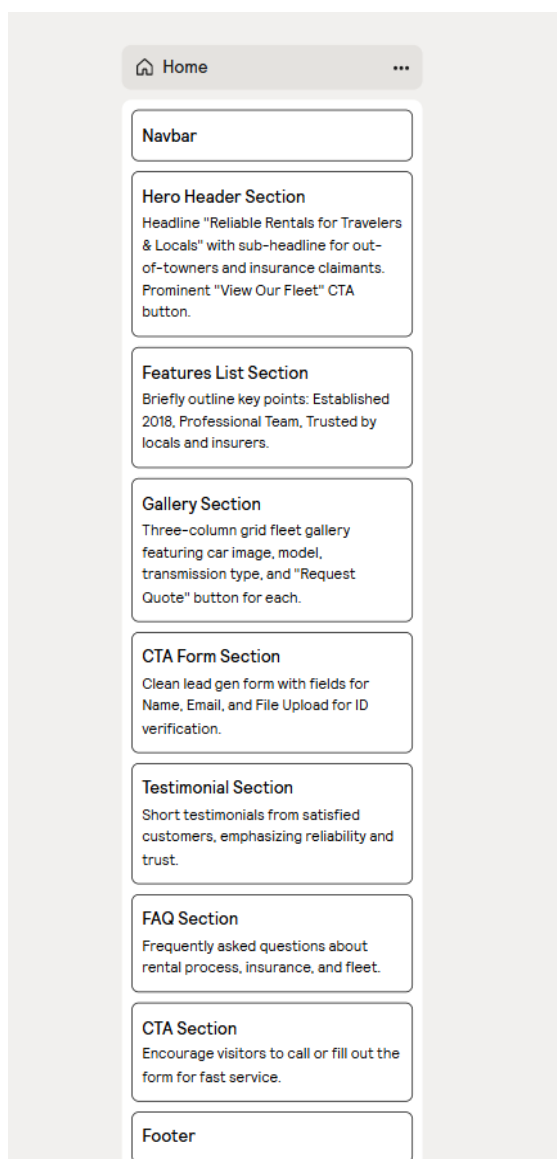

Target audience (demographics & technical aptitude)

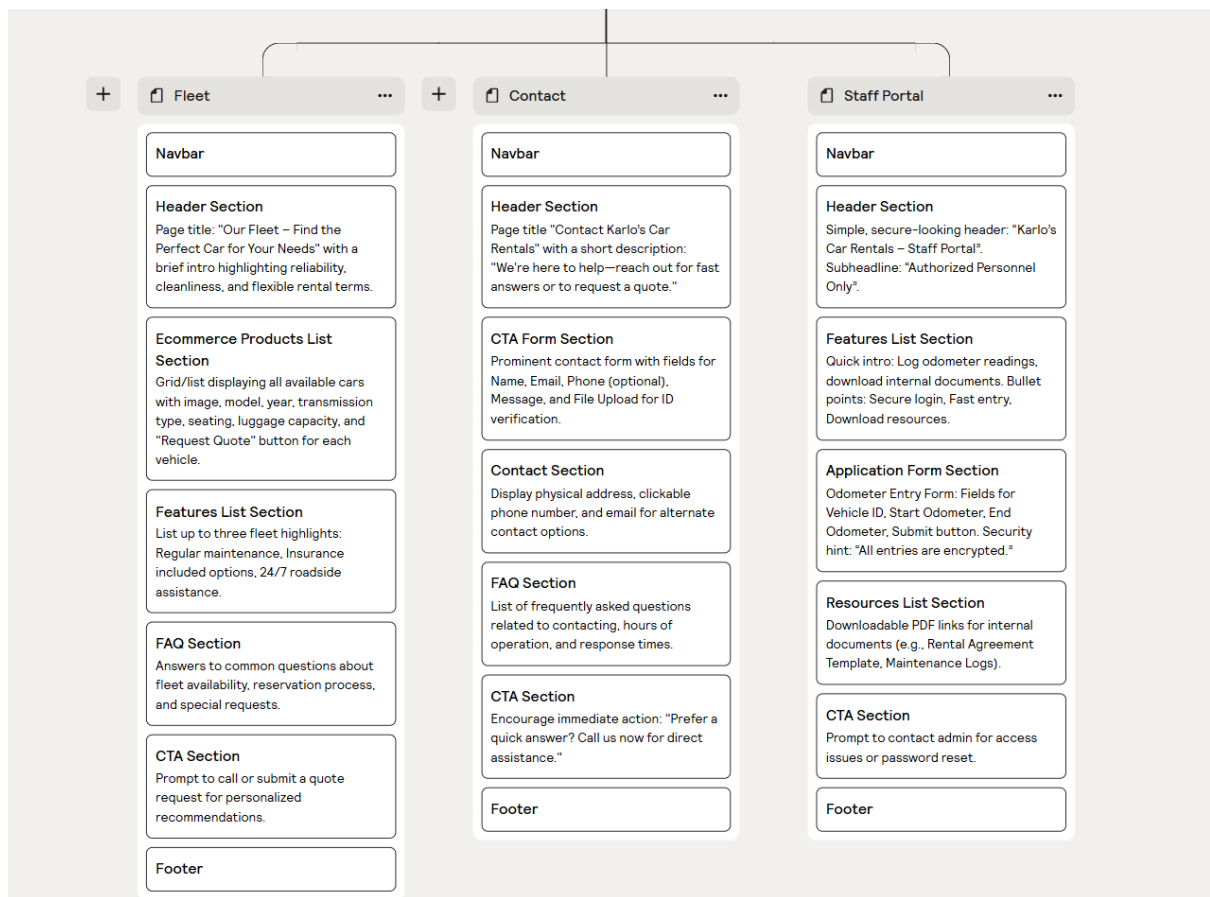

- Main audience: Locals and visitors looking for information on renting or renting a car
Adults 22–65+, locals, tourists, and business travellers make up the demographics and income levels vary according on the type of vehicle.
Technical aptitude: Low to moderate; majority utilise cellphones and search engines; rather than conducting business online, anticipate to make a call or fill out a straightforward contact form.
- Suppliers, corporate clients, and partners make up the secondary audience.
Demographics: Local companies or agencies seeking corporate agreements or fleet hire.
Technical aptitude: Moderate; clear communication channels and downloadable PDFs are expected.
- Internal audience: Accountant and employees
To change content and locate contact/operational procedures.

Website Type

A general business service website (informational) does not include an online booking or payment system, but it does advertise the company, showcase services and car offers, gather leads and queries (contact forms, phone/email), and provide information to personnel.

Information design and taxonomy

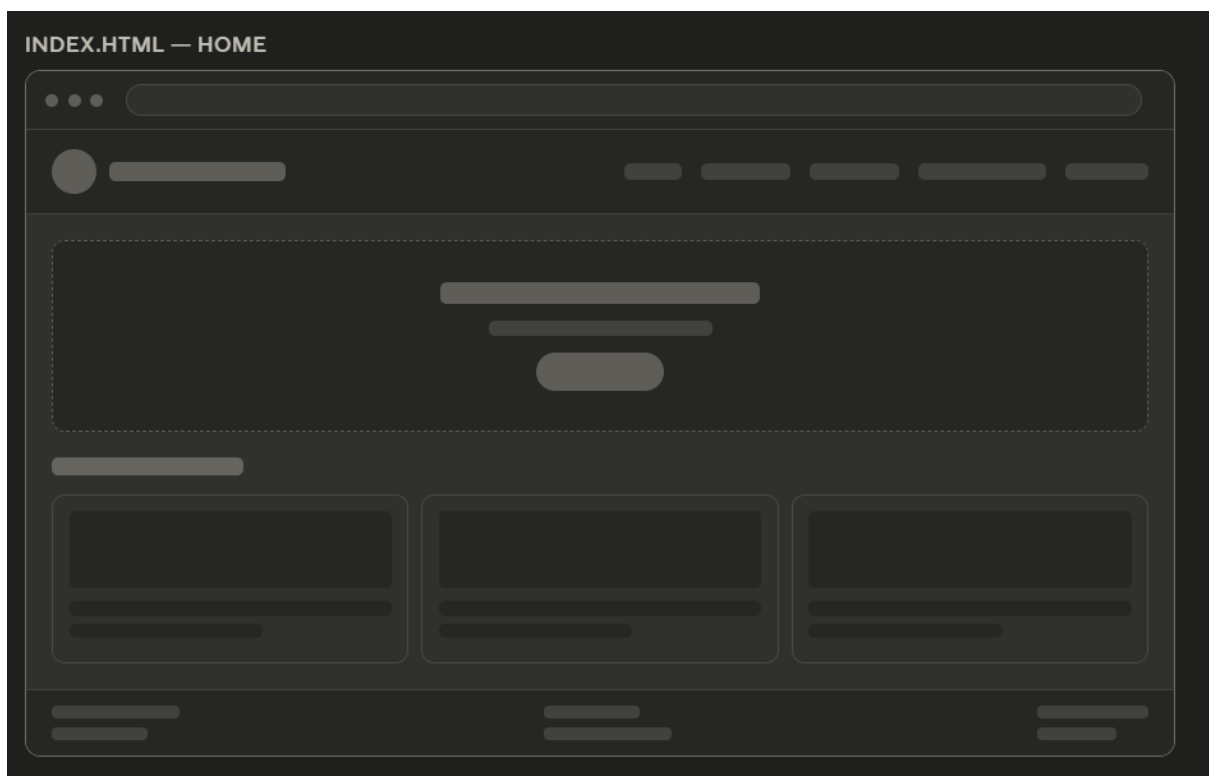

Technical briefs

- JavaScript for dynamic behaviour and interaction;
 - CSS3 for presentation and styling; and
 - HTML5 for the website's structural layer
- For responsive frameworks, use Bootstrap5.

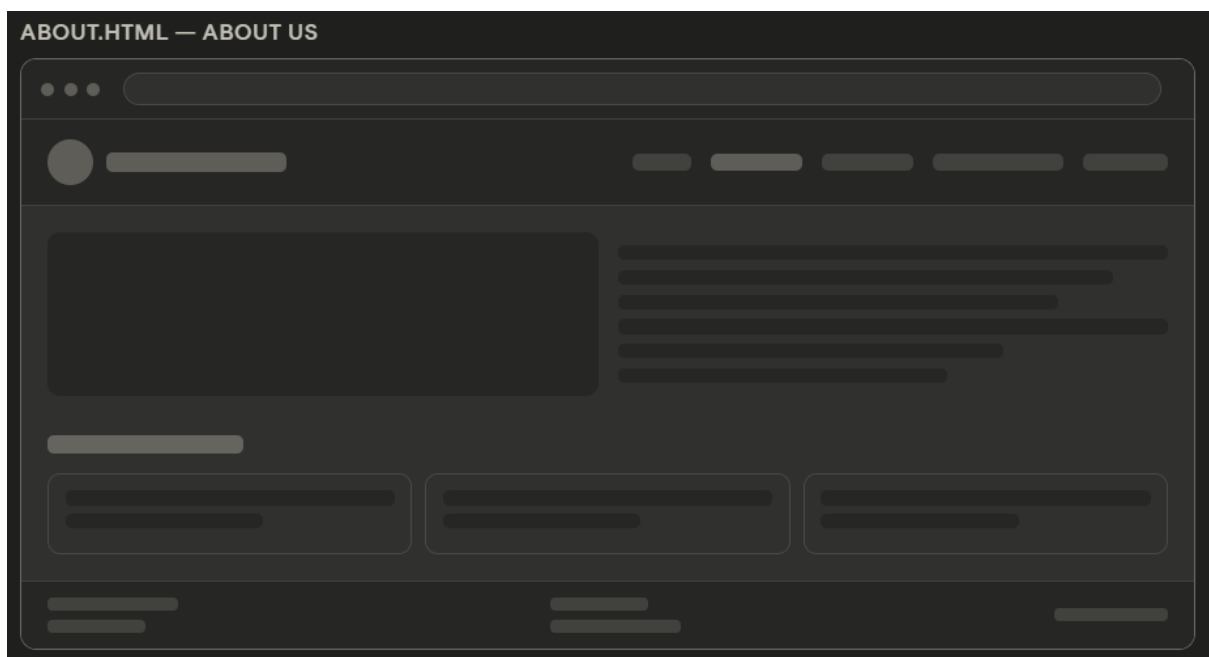

Page Template Design

Low fidelity Wireframe

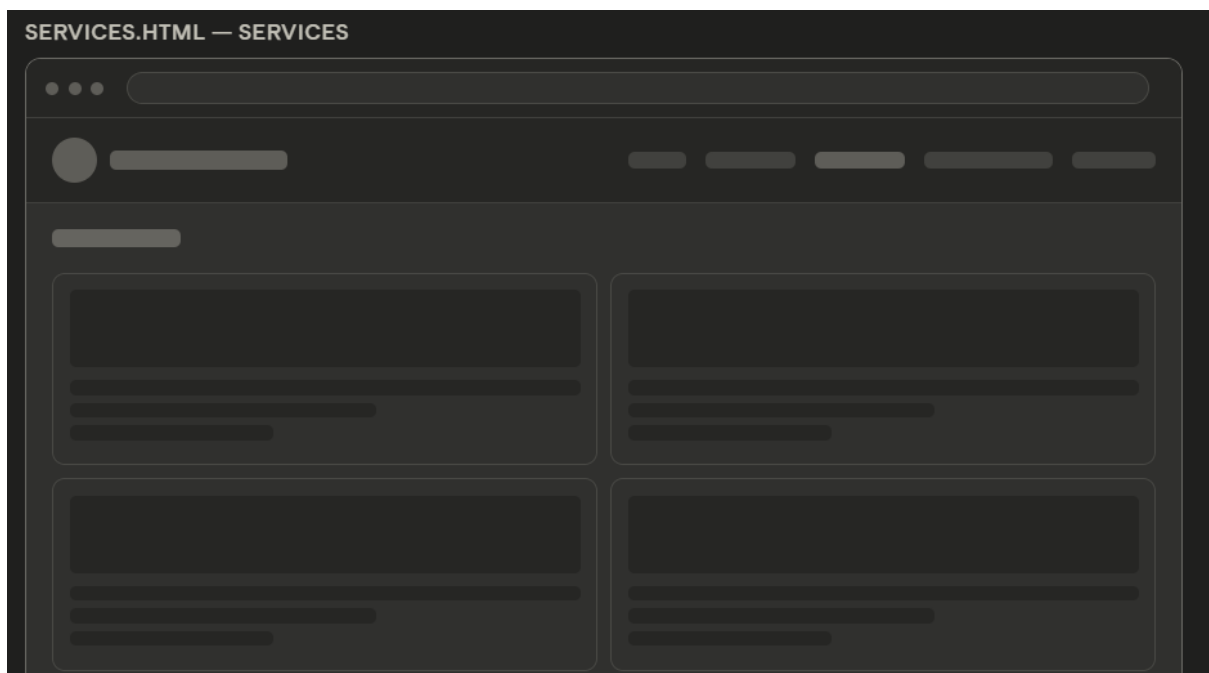

Index.html — This is the landing page. It leads with a hero banner (headline, tagline, and a CTA button like "Book Now"), followed by a featured car grid showcasing available vehicles, then a footer with contact info.

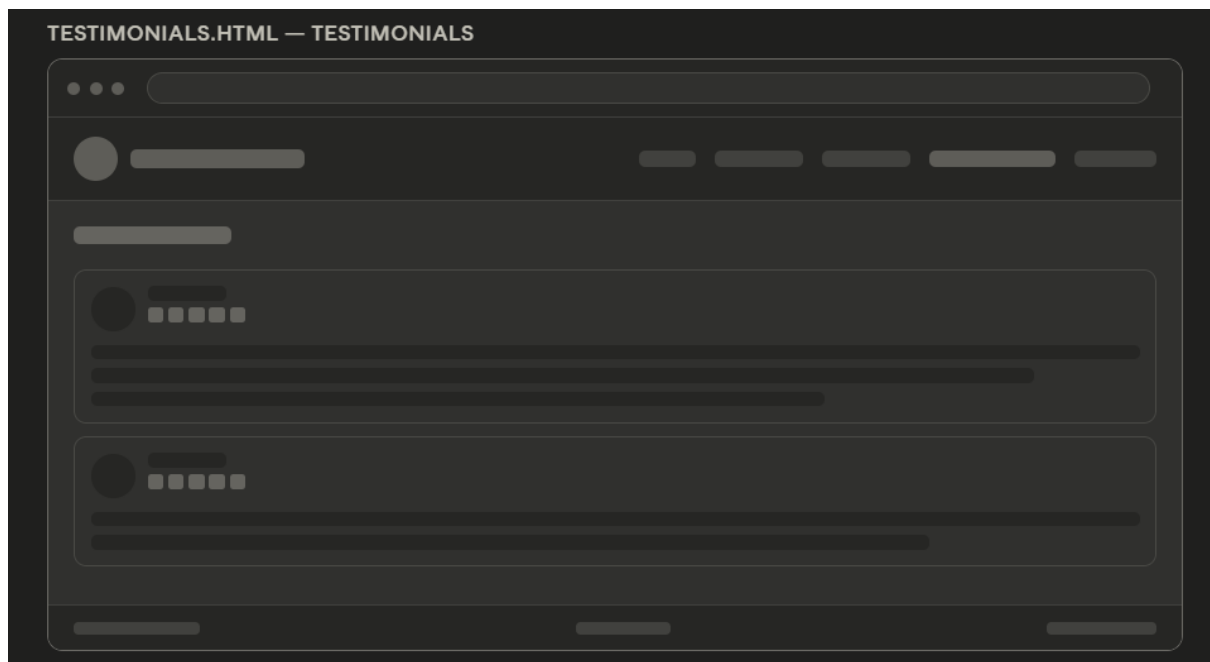

About.html — About Us introduces the company. It uses a two-column layout which includes a photo or image on the left, with a text block on the right describing the business story or mission. Below that, a row of stats/value cards (e.g. years in business, fleet size, customer count)

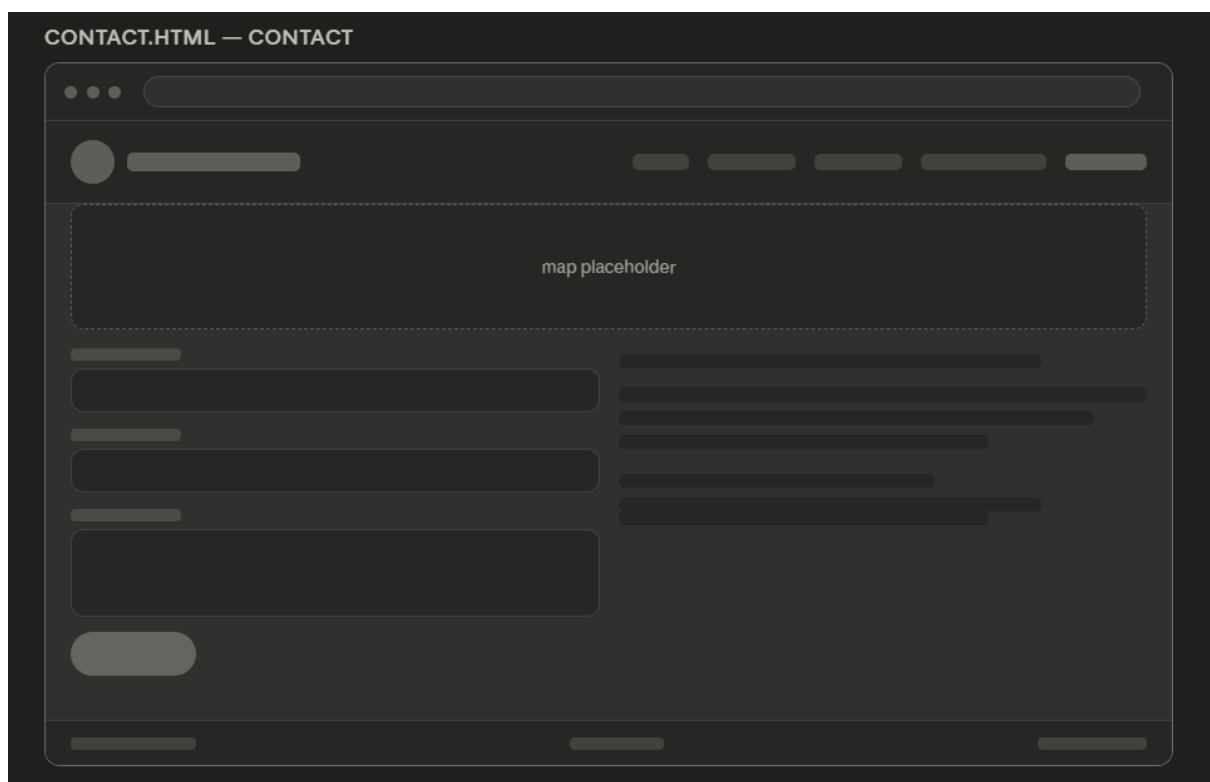

Services.html — **Services** details what the company offers. A 2×2 card grid presents individual service types , each with an icon or image, a title, and a short description

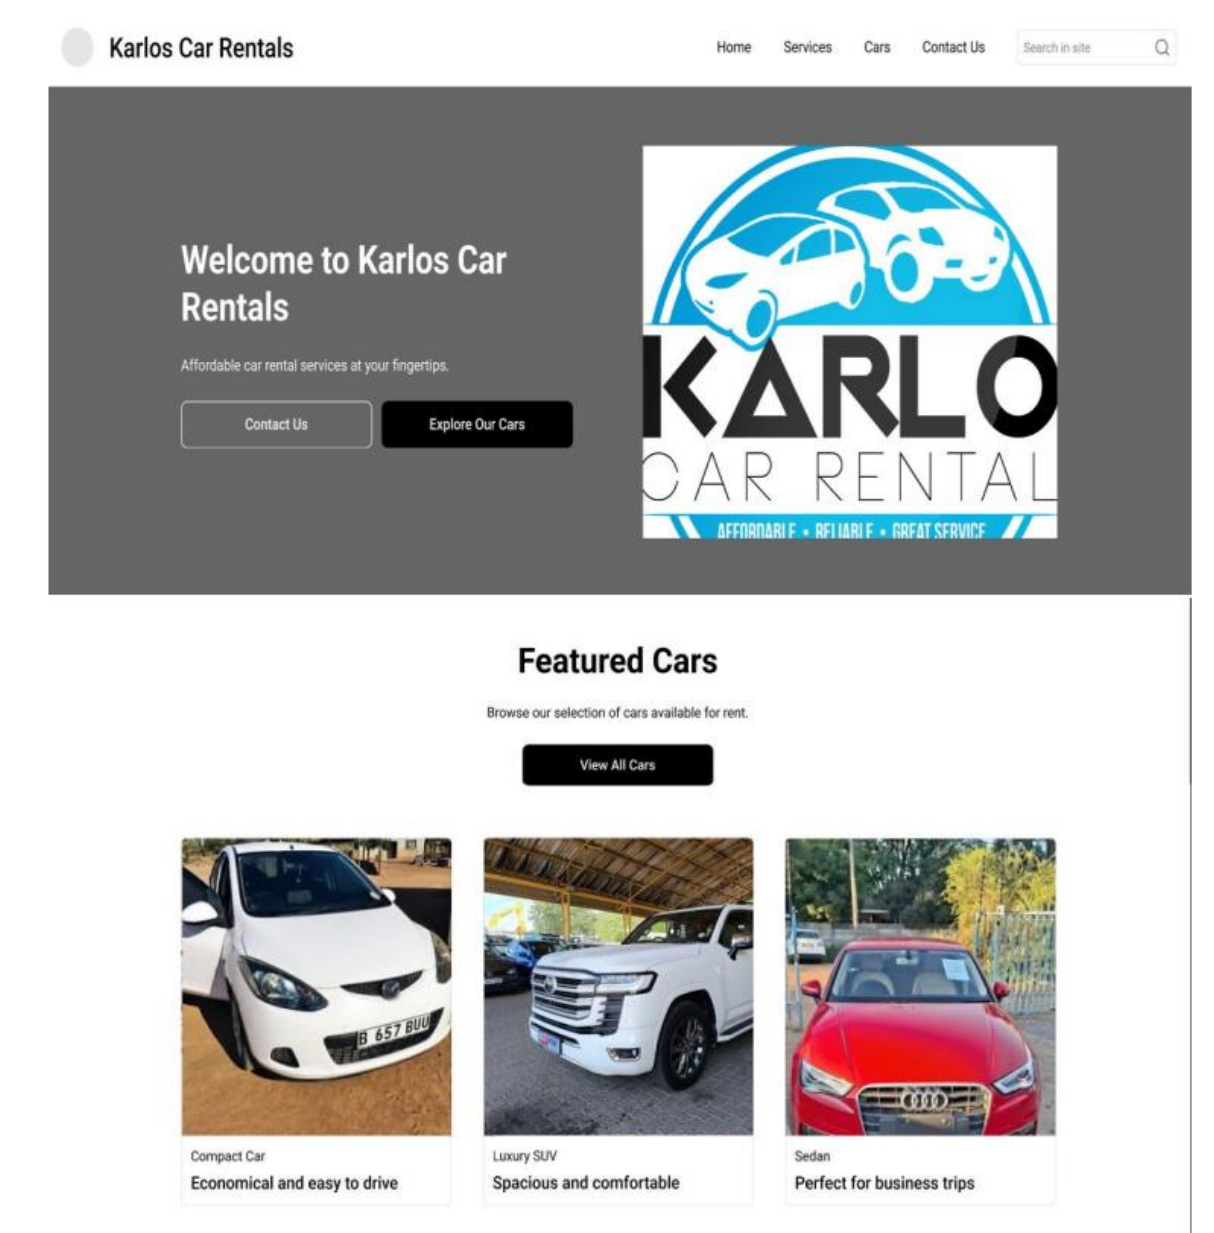

Testimonials.html — **Testimonials** is a social proof page. It displays stacked customer review cards, each with an avatar, name, star rating, and a short quote — building trust with prospective customers.

Contact.html — Contact combines a map placeholder at the top with a contact form (name, email, message, submit button) , and address/phone information. The active nav item shifts to highlight the current page across all five pages.

High fidelity Wireframe

Affordable Prices
We offer competitive pricing for all our car rentals.

Flexible Rentals
Choose your rental duration, from hourly to weekly.

24/7 Support
Our team is available around the clock to assist you.

Easy Booking
Quick and hassle-free booking process online.

What Our Customers Say

Quality Assurance

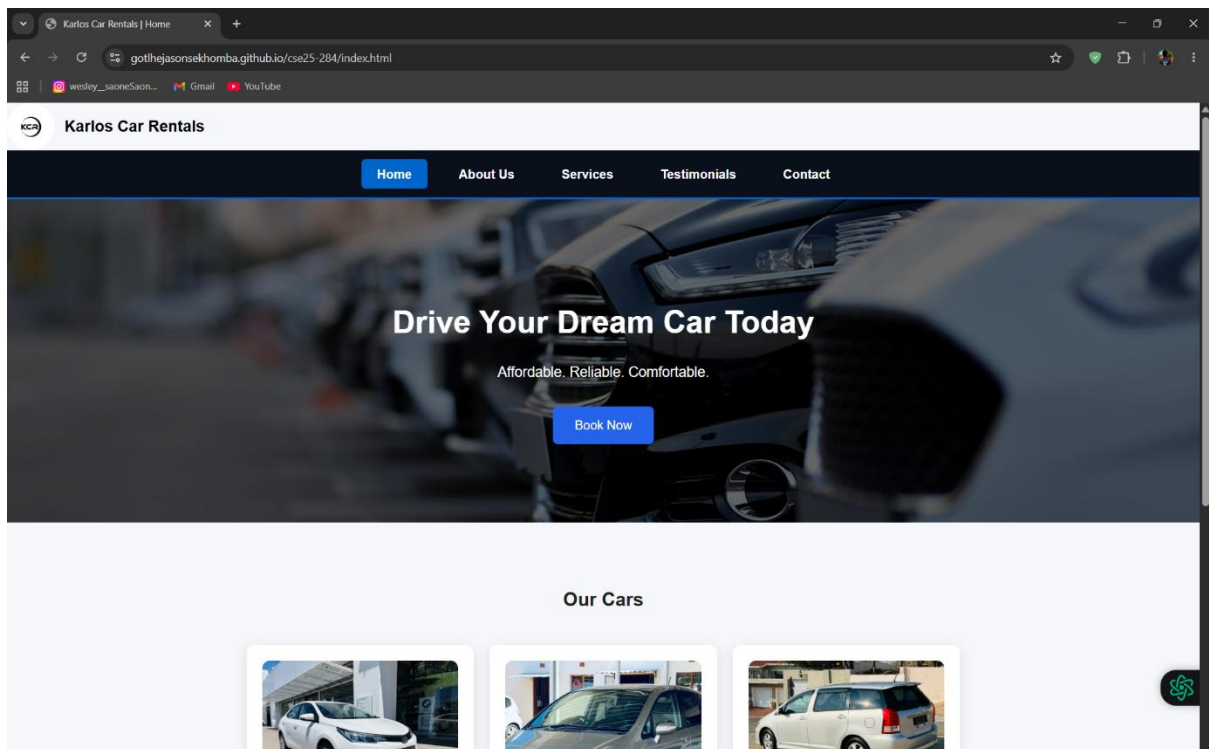

The Karlos Car Rental website was tested for cross browser compatibility and device compatibility across multiple browsers and devices to ensure consistency, responsiveness and user experience.

Windows laptop/Desktop ran the website using Microsoft Edge and later on ran it on Google Chrome. Below is the screenshot respectively:

Microsoft Edge:

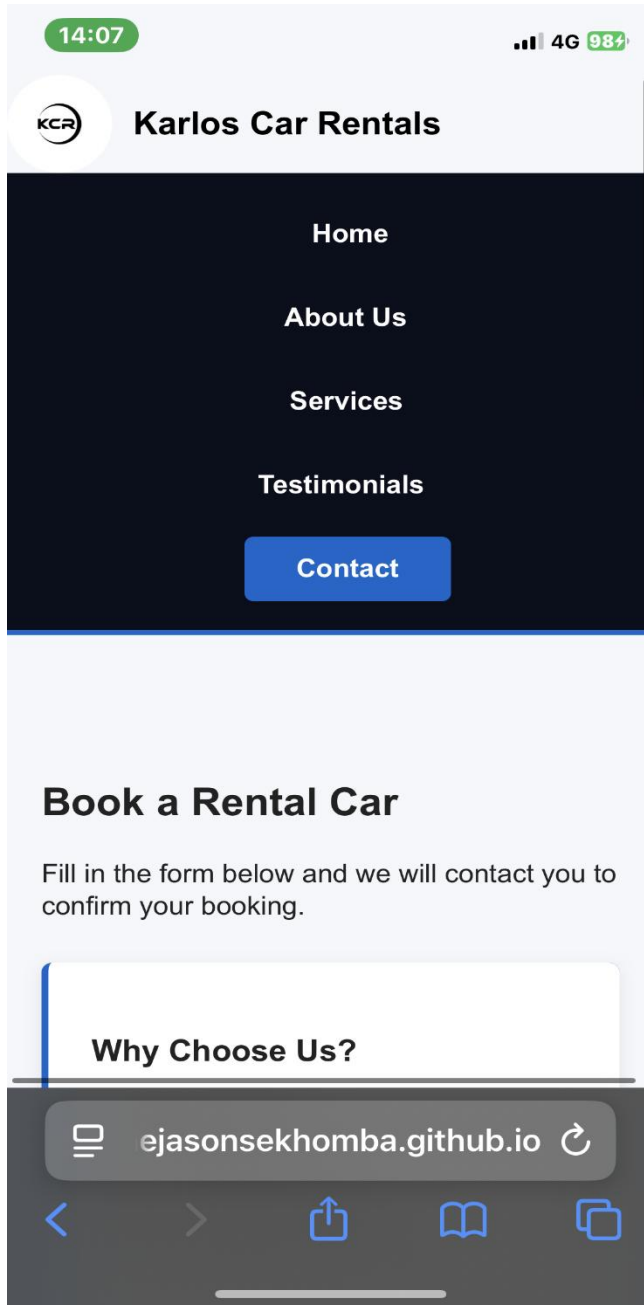

Google Chrome on Desktop:

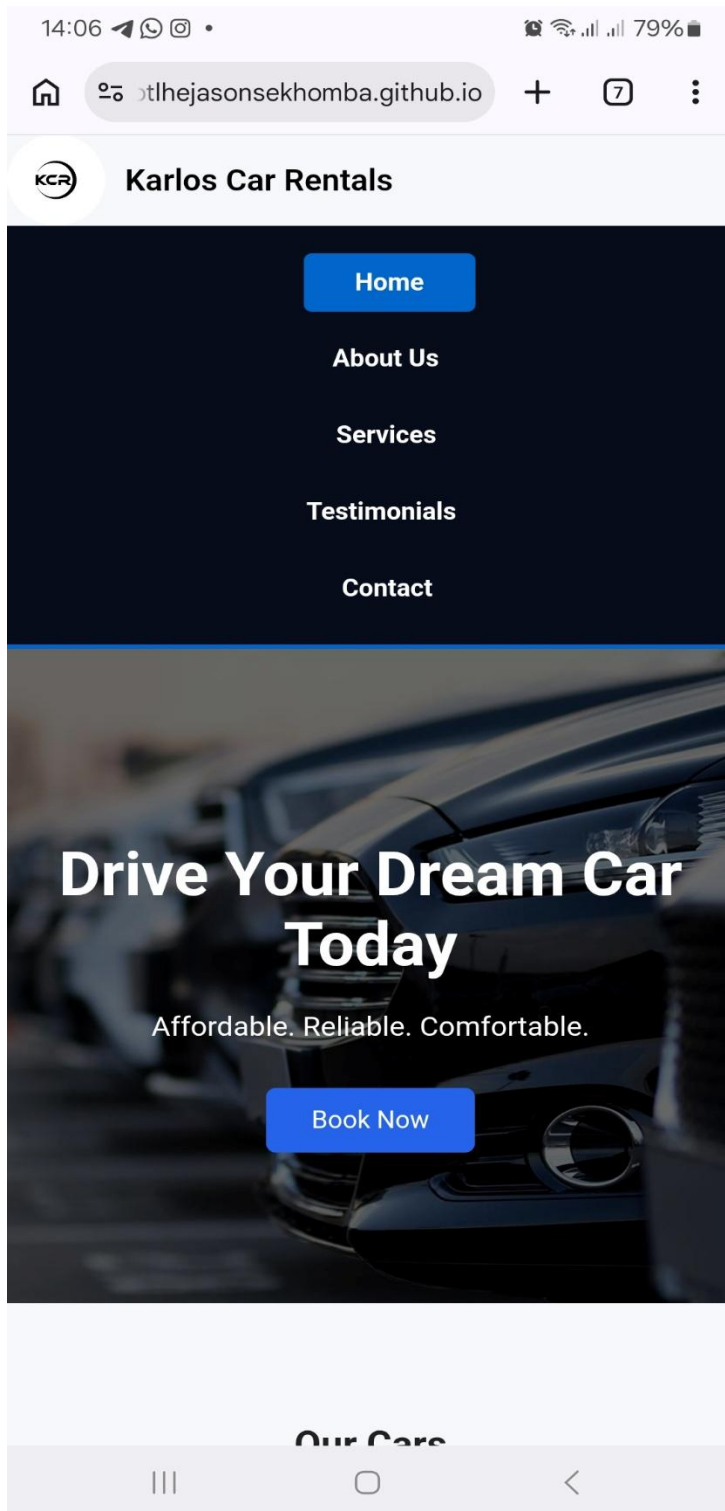

The Karlos Car Rental website was then ran on an iPhone using Safari and later on ran on an android device using Google Chrome. Below are the screenshots:

The iPhone screenshot:

Andriod Screenshot:

- The website loaded correctly with responsive layout and functional navigation, all sections rendered properly and booking form functioned correctly throughout the devices and web browsers.

Publishing and Promotion:

1. Making the Files for the Website

Visual Studio Code was used to develop the website pages using HTML and CSS. Pages from the project included:

- Homepage
- About Us
- Contact
- Services
- Testimonials

Additionally, styling files and images were included to enhance the website's design.

2. Creating a Respository

To store the website files online, a GitHub repository was established.

3. Opening CMD in the Project Folder

The Command Prompt was opened inside the project folder where the website files were saved.

e.g `cd Desktop/Karlos_Car_Rentals`

4. Setting Up Git

The following command was used to initialise Git inside the project folder:

```
git init
```

5. Adding Webfiles

Every website file was added to the Git tracking system using:

```
git add .
```

6. Committing the Files

The files were then saved into the Git repository using:

```
git commit -m "Initial website upload"
```

7. Linking the Project to GitHub

The local project was linked to the GitHub repository using:

```
git remote add origin https://github.com/GotlheJasonSekhomba/cse25-284.git
```

8. File Uploading to GitHub

The following commands were used to upload the website files to GitHub:

```
git branch -M main
```

```
git push -u origin main
```

9. Website Link Address

The website became active through the following link format:

<https://github.com/GotlheJasonSekhomba/cse25-284.git>

Future Developments/Recommendations

- Although the website functions effectively, there is certainly room for development. Customers can reserve cars straight from the website by adding an online booking system. To make payments simpler and quicker for clients, online payment methods like bank cards and mobile money can also be incorporated.
- Additionally, the website can be made to function better on tablets and smartphones. Features like customer accounts and live chat assistance can enhance communication and make the website easier to use. To safeguard client data, further security elements can be included.
- Better search and filter features could be added to the website in the future to enable users to locate cars quickly by type, price, or availability. To handle reservations and client data more effectively, a database system can also be incorporated.
- Regular upgrades and maintenance are necessary to keep the website functioning effectively. Information, prices, and new cars should all be updated as needed. To prevent losing crucial information, website files should also be routinely backed up.
